

A friend of mine has seen the gold Paul Wadsworth and Wanita Hansen took off the discovery location and swears it was pure, solid, more than an inch thick and the size of the palm of your hand! Samples taken from the propery have been assayed at more than 353 ounces per ton GOLD.

Paul Wadsworth discovered coarse gold in a quartz vein on May 23, 1998. The vein was exposed on a logging road. This area was previously explored for molybdenum at the Big Joe (1031 023 MINFILE). This vein was hand mined from a 14 metres length to a depth of about 1 metre. The hostrock is coarse grit and pebble conglomerate and greywacke which contains metamorphic muscovite. The strata strike 060 degrees and dip 30 degrees southeast. The Wadsworth vein strikes 175 degrees and dips 80 degrees east. Granodiorite is exposed 150 metres southwest of the vein.

THIS PROPERTY NEEDS DRILLED

Update:

I decided to fly up to Terrace at the end of May 2022 and view the property for myself. The showing had been blasted out and picked clean, probably a thousand times over. However... we did manage to scratch out three very nice samples from within the blasted rubble. As you can see the Tungsten is directly tied in with the gold. All samples from within the property return high levels of tungsten in almost all XRF samples including host and wall-rock.

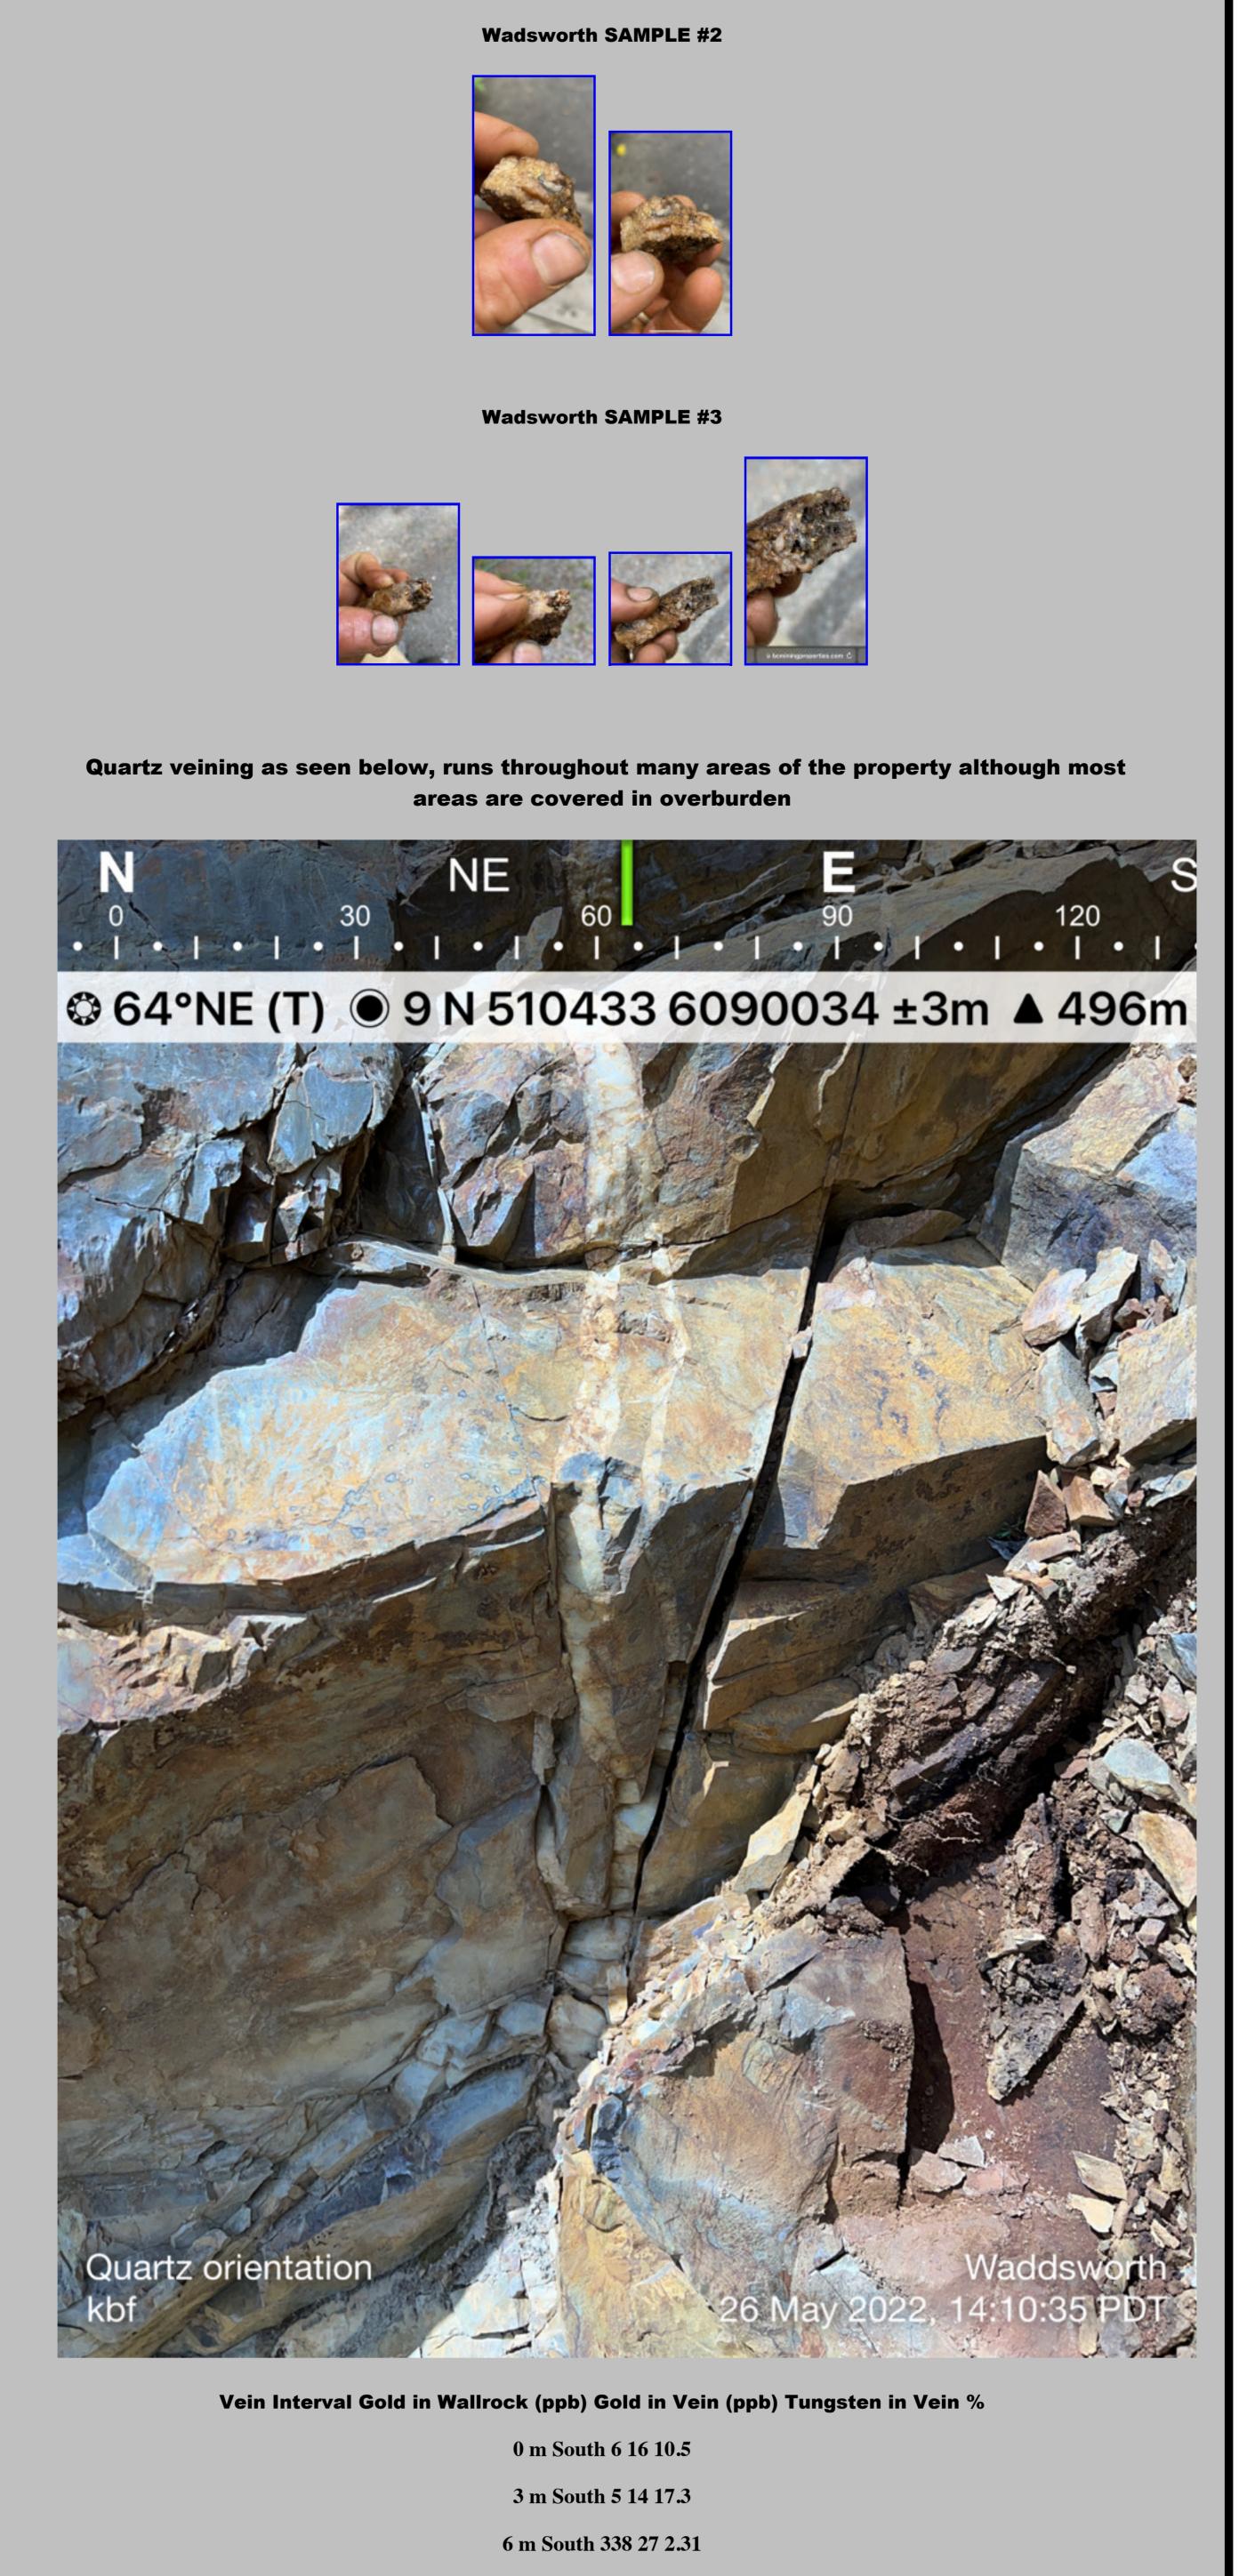

Have a look...

The gold from this property is spectacular!
